GSM SYSTEM

GSM

TAKE ADVANTAGE OF THE GSM NETWORK SYSTEM WITHOUT LIMITATIONS

5 Auto Dialed numbers per button	**1000** Users	**Remote** Key code programming	**2** Output relays	**2000** access control codes	**Dial to open** opening with telephone ring

The GSM system is designed to be used in scenarios where it is not possible to install a traditional video door entry system. It's operation through the mobile telephone network is suitable in contexts where there is a large distance between the entrance and the building, or when the external unit must be connected to a fixed or mobile telephone.

The installation of the external unit is performed in "stand alone" mode, connecting it to a power supply and to the antenna for receiving the GSM signal.

A special feature of the system is the "dial to open" function which allows the opening of a gate with a simple telephone call.

FEATURES

- Program via SMS or software
- Dial up to 1000 telephone numbers
- Can be powered by a CAME control board
- Dial to open
- Two output relays
- Voice mail avoidance setting
